

Security

Highlight Feature

- > Protect your data from unauthorised access and make sure that what is yours, stays yours.
- > State-of-the-art security features standard with all new Toshiba systems.
- > Increase your data security by using a Toshiba MFP to safeguard the information which is most valuable to you.

Your challenge

In today's world an MFP handles more than just paper. It processes large amounts of sensitive data, is part of complex digital workflows and is accessed by many people from different devices. So how do you ensure that information does not end up in the wrong hands by mistake?

Our solution

Toshiba offer various possibilities of securing your data and documents to help your business meet the increasing security challenges of today's world. All our e-BRIDGE Next models fulfil the highest security standards to protect your data from unwanted access without compromising the efficiency and performance of the systems.

Various features - such as the Toshiba self encrypted HDD, role-based access control or user authentication at the device will let you decide which information should be given to whom. Once you have set the rules, the MFP will protect your data for you.

Your benefits

When using all standard features offered on the new Toshiba systems, you can be sure your business critical data is safe. Role-based access rights and built-in user authentication regulate who may retrieve or show which document.

Additionally, the hard disk drive in Toshiba MFPs uses a complex encryption and authentication method, which only allows the MFP it has been installed in to access the data. If removed and connected to another PC or MFP the data can not be extracted. Instead the encryption key, which is stored on the HDD itself, will be deleted. This also ensures that you can instantly and permanently delete the entire data on the HDD at the end-of-life of your MFP.

Protecting your data

Where to use

Every business wants their data to be safe, but for some this is critical. Leakage of information or confidential data can result in a financial disaster or crisis.

- > Medical
 - Protect confidential patient information
- > Law firms
 - Ensure only authorised personnel gain access to your clients' data.
- > Manufacturing
 - Ensure your blueprints and design details remain safe from industrial espionage.

Don't let security threats restrict your growth and success. Focus on your core business and let us protect your valuable information.
